

# EMBEDDED COMPUTER VISION APPLICATIONS WITH QT

basysKom GmbH

Torsten Rahn

# CONTENT

- Introduction
- Qt and OpenCV
- Conclusion

# INTRODUCTION

# Who we are

## **basysKom**

- Located in Darmstadt & Nürnberg
- Software Engineering Services (Consulting, Training, Coaching & Development)

## **Myself**

- Software Engineer
- [torsten.rahn@basyskom.com](mailto:torsten.rahn@basyskom.com)

## Our Background

- Software Engineering Services (Consulting, Training, Coaching & Development)
- Focused on industrial applications

A great deal of experience with Application/  
HMI development (Qt & HTML5) and  
connectivity (OPC UA/MQTT/REST)

# QT AND OPENCV

# OpenCV

## Open Source Computer Vision Library

- Website: [opencv.org](http://opencv.org)
- Current Version: 4.0.1
- Languages: C++ (native), Java, Python
- Platforms: Windows, Linux, Mac OS, iOS and Android
- License: BSD

- 2D and 3D feature toolkits
- Egomotion estimation
- Facial recognition system
- Gesture recognition
- Human–Computer Interaction
- Mobile robotics
- Motion understanding
- Object identification
- Segmentation and recognition
- Structure from motion (SFM)
- Motion tracking
- Augmented Reality

# Qt

## Cross-platform software development for embedded & desktop

- Website: [qt.io](http://qt.io)
- Current Version: 5.12
- Cross Platform
- License: Dual-License – Commercial & Open Source

### “Classical” Qt Framework

- language: native C++ / Bindings
- compiled
- imperative

QObject

### Qt Quick

- language: QML (Javascript / CSS / JSON)
- interpreted (compiling optional)
- declarative

# Qt Quick and OpenCV

## Computer Vision meets modern HMI-Development

- **Advantage:**
  - OpenCV's computer vision algorithms
  - fast and fluid Qt Quick User Interface on embedded
- **Challenge:**
  - Qt and OpenCV are using different
    - API patterns
    - data structures

Let's bridge the gap ...

## Qt and OpenCV: Image Format Conversion

Qt and OpenCV are using different storage data types for images

- OpenCV uses a matrix `cv::Mat` with data stored in GBR channel order in columns and rows

```
cv::Mat cvImage = cv::imread("foo.png",  
                             CV_LOAD_IMAGE_COLOR);  
QImage img((uchar*) cvImage.data,  
           cvImage.cols, cvImage.rows,  
           cvImage.step, QImage::Format_RGB888);  
img = img.rgbSwapped().copy();
```

- Channel order for `QImage` depends on *Endianness* – except for RGB888 format where it's always RGB
- GBR → RGB via `QImage::rgbSwapped()`

# Introduction to QML

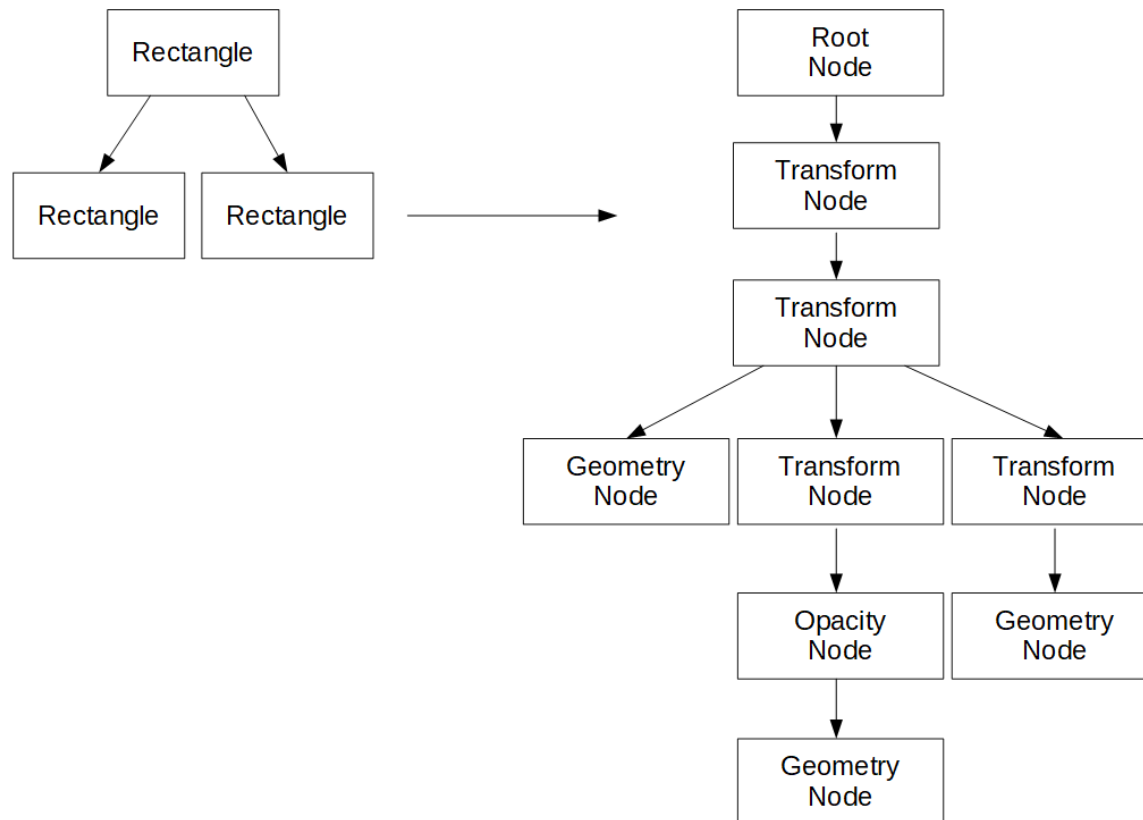

```
import QtQuick 2.0
```

```
Rectangle {  
    id: root  
    width: 300; height: 350  
    color: "blue"  
    Rectangle {  
        anchors {left: parent.left; anchors.top: parent.top}  
        width: parent.width/2; height: parent.height/2  
        color: "green"  
    }  
    Rectangle {  
        anchors {right: parent.right; bottom: parent.bottom}  
        width: parent.width/2; height: parent.height/2  
        color: "yellow"  
    }  
}
```

## Concept

- Elements
- ids
- Properties
- Property-Bindings

## Qt Quick Scenegraph

### Concept

- Optimized for requirements of modern graphics hardware
- Uses OpenGL commands
- Transform nodes encode affine Transformations as 4x4 matrices
- Geometry nodes ...
  - manage geometry buffer
  - define material

## Combining OpenCV with QML

```
Item {  
    width: 300; height: 300  
  
    CVMat {  
        source: "foo.jpg"  
        anchors {left: parent.left;  
            anchors.top: parent.top; anchors.bottom: parent.bottom}  
        width: parent.width / 2  
    }  
    CVContour {  
        input: inputImage  
        anchors {right: parent.right;  
            anchors.top: parent.top; anchors.bottom: parent.bottom}  
        width: parent.width / 2; height: parent.height / 2  
    }  
}
```

# CVMat - Implementing a QQuickItem using OpenCV

## Inheritance from QQuickItem

- Don't forget to set the flag `ItemHasContents` in the ctor

```
QSGNode *AbstractMat::updatePaintNode(QSGNode *oldNode, QQuickItem::UpdatePaintNodeData *)
{
    QSGSimpleTextureNode *node = static_cast<QSGSimpleTextureNode *>(oldNode);
    if (!node) {
        node = new QSGSimpleTextureNode();
        QImage img((uchar*) m_cvImage.data, m_cvImage.cols, m_cvImage.rows,
                   m_cvImage.step, QImage::Format_RGB888);
        img = img.rgbSwapped().copy();
        QSGTexture *texture = window()->createTextureFromImage(img);
        node->setTexture(texture);
    }
    node->setRect(boundingRect());
    return node;
}
```

# CVContours - Finding Contours with OpenCV

## Using findContours()

- For preparation we need to convert the image into a binary black-and-white image:

```
Mat gray;  
cvtColor(*mat, gray, COLOR_BGR2GRAY);  
Mat bw;  
threshold(gray, bw, 50, 255, THRESH_BINARY | THRESH_OTSU);  
vector<vector<Point>> contours;  
  
findContours(bw, contours, RETR_LIST, CV_CHAIN_APPROX_SIMPLE);  
|
```

- Alternatively we could call `Canny()` instead of `threshold()`
- Afterwards we could call `drawContours()` or ...

## Application Example

### Live Demo

Our demo application additionally uses

- Qt Quick Controls 2
- Qt Quick Shape API (available since 5.10)

# LiveCV

<http://livecv.dinusv.com/>

**D** Live CV - Live Computer Vision Coding

```

import "lcvimgproc" 1.0
import "lcvcontrols" 1.0

Grid{
  columns : 2

  ImRead{
    id : buildings
    file : "D:/buildings.jpg"
  }

  ChannelSelect{
    id : channelSelect
    input : buildings.output
    channel : 2 // red channel
    RegionSelection{
      anchors.fill : parent
      item : selectedRegion
    }
  }

  Canny{
    id : canny
    input : channelSelect.output
    threshold1 : 85
    threshold2 : 210
  }

  MatRoi{
    id : selectedRegion
    input : channelSelect.output
    width : 100
    height : 100
    regionwidth : 10
    regionHeight : 10
    linearFilter : false
  }
}

```

The screenshot shows the LiveCV web interface. On the left, there's a code editor with OpenCL code for image processing. On the right, there's a video feed of a building facade. Below the video feed, there's a processed image showing the edges of the building facade. The interface also includes a 'Später ansehen' button and a 'Teilen' button.

# CONCLUSION

## Conclusion

### **Combination of Qt Quick and OpenCV provides a solid foundation for Computer Vision HMIs**

- Differences regarding APIs should be taken into account right from the start
- Qt Quick provides flexible means for interaction and UI rendering
- LiveCV provides a great environment for interactive prototyping
